**Using Biodiversity Information Effectively**  
By Dr. A. Feast  
As a teacher of ecology to non-ecologists, I have to recognise that their intellectual training does not equip them for some elements of ecology. Particularly difficult is taxonomy since the use of lists of English names (or worse still Latin names) produces a glazed look on student's faces. The identity of species is very important in ecology as without an identity there is difficulty in predicting an organism's activity and response to change. Similarly for geneticists/biotechnologists the identity of organisms is of prime importance and yet they frequently have the knowledge of only a few species.

**A Specialized Nanoparticle for Detection of Cancer Cells**  
A team of Korean scientists, led by Professors Cheon Jin-Woo and Suh Jin-Suck, has developed a diagnostic technique to identify cancer cells. The team claims that this diagnostic technique is more effective in locating the cancer cells than the existing magnetic resonance imaging (MRI) devices. This discovery apparently paves the way for early diagnosis and a more effective treatment. The results were published in the latest online edition of the journal *Nature Medicine*.
